

HISTORY OF C

Basically **C language** introduced in **1972** by “**DENNIS RITCHIE**”, One of the software engineer in **AT & T** [American Telephone & Telegraph] **Bell labs**.

Ritchie adopted [taken from] **C language** from **B language**, designed by “**KEN THOMSON**”, one of the software engineer in AT & T Bell labs.

Thomson adopted **B language** from **BCPL** [Basic Combined Programming Language] , developed by “**MARTIEN RICHARDS**”, one of the Assistant professor in Cambridge University.

In **1989 ANSI** [American National Standards Institute] released a new version of C language with the name “**ANSI-C**”, which is familiar with the name “**C-89**”.

In **1999 ISO** [International Standard Organization] releases a new version of c language with the name “**C-99**”.

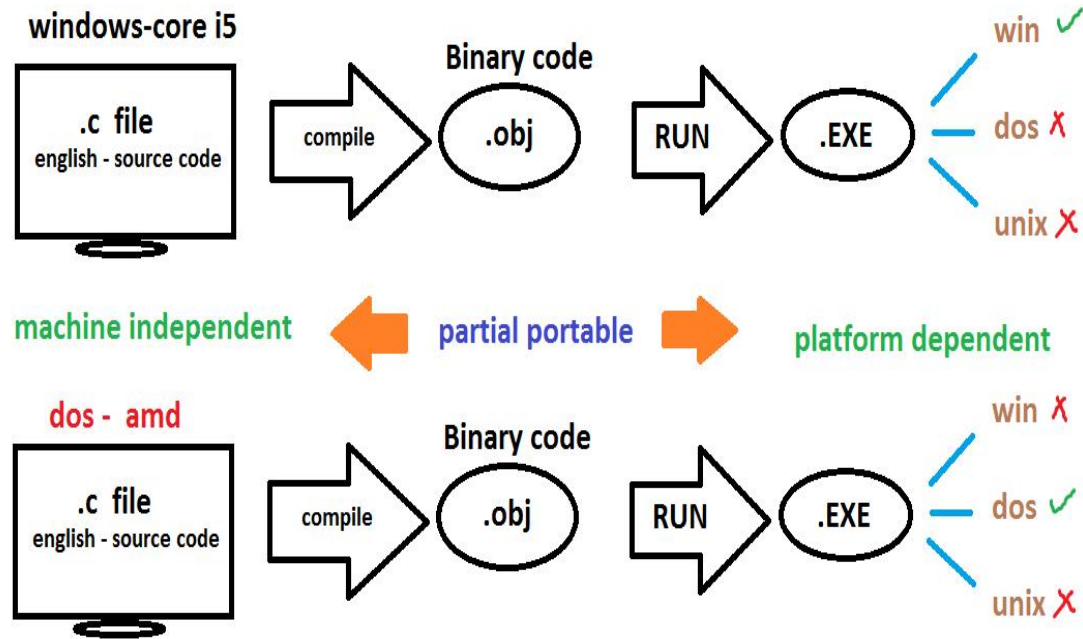

Basically C language developed to rewrite **UNIX** operating system. But nowadays we can create and execute a c program on any machine with any processor.

i.e. **we can run c program on 80386 / 80486 / 80586 / intel core i3 / i5 / i7 / i99 / AMD processor etc. hence C is called it is a machine independent programming language.**

For example the languages like **8086 / 8088** are working only on **8086 & 8088** processors. Hence they are called **machine dependent programming languages.**

But **c is a platform dependent programming language.** i.e. the application designed with C language for one operating system is not working in another type of operating system. For example the application designed with c language for windows is not working in UNIX operating system. **Due to this problem we can't develop web applications with C language and we can develop only the standalone applications.** Standalone application installed in a single system and operated only from that system. Hence is also called it is a **partial portable language.**

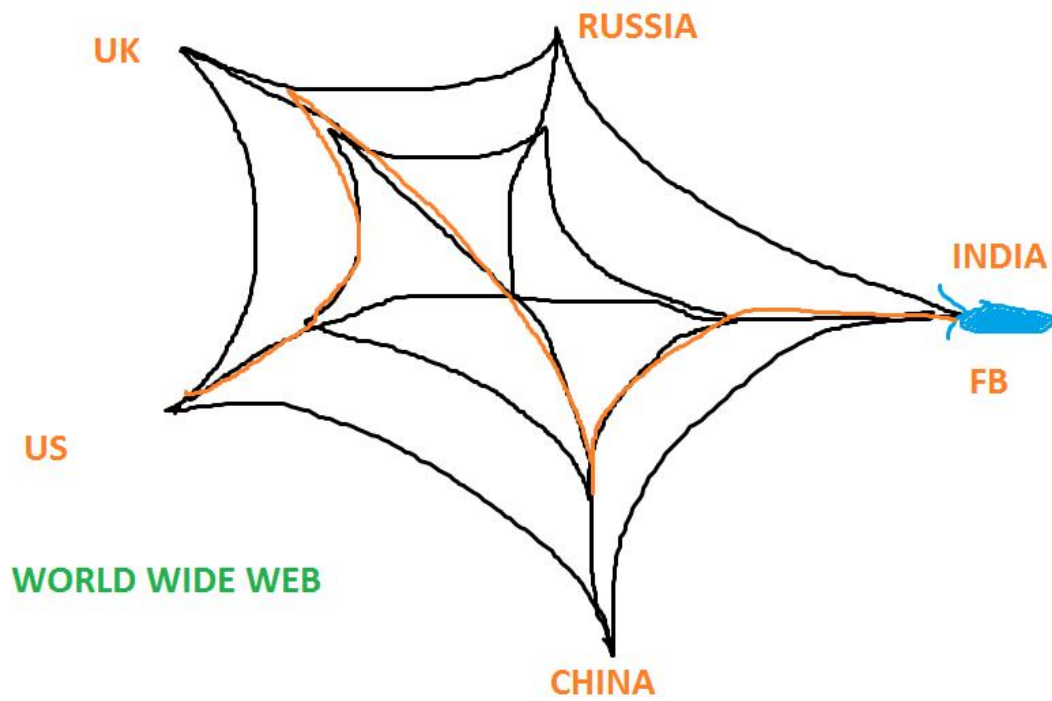

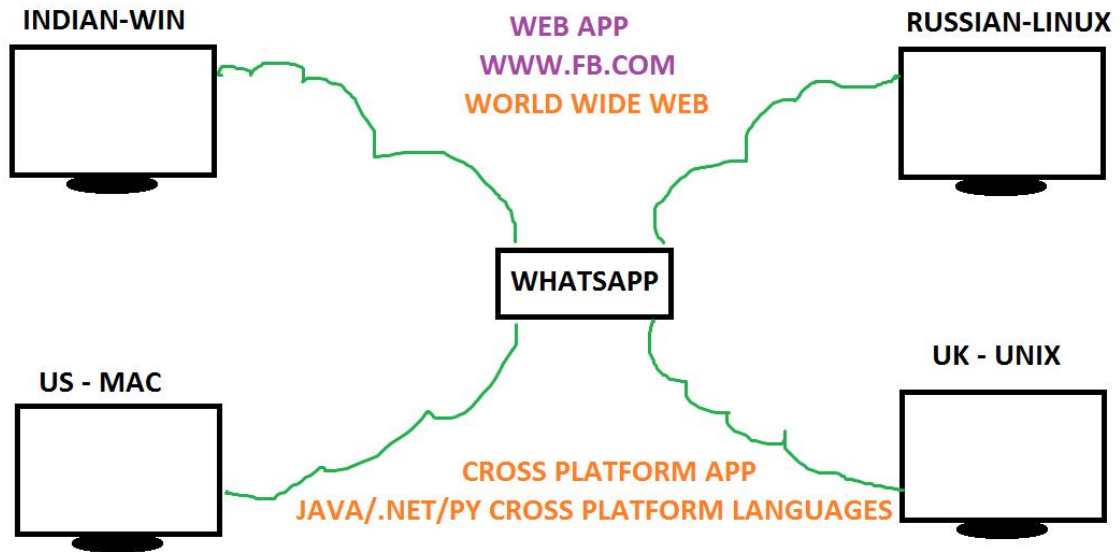

To develop web applications we have to use the **portable languages** like java / .net / python etc, which are **machine independent** and **platform independent languages.**

MNP - MOBILE NO PORTABILITY

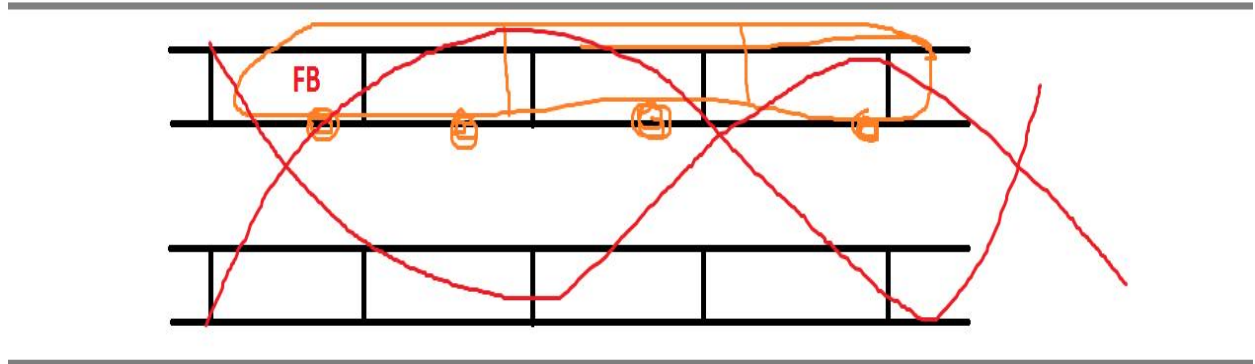

WORA - WRITE ONCE RUN ANYWHERE

WINDOWS

PLATFORM 1

PLATFORM 2

UNIX

CROSS PLATFORM APP

LAN – LOCAL AREA NETWORK - LOCAL OFFICE

MAN – METROPOLITAN AREA NETWORK – CITY

WAN – WIDE AREA NETWORK- INTERNET
